

GUANELLA PASS ROAD

Color-Stained MSE Wall (Being used in non-higher priority fill wall areas)

Description:

Staining the mechanically stabilized earth (MSE) retaining walls will consist of spraying a water-base stain on the facing of the retaining wall. This staining process will enable the retaining wall to blend into the natural setting.

Approximate Cost:

Relatively Minor Staining cost.

Advantages

- ♦ Lower Cost.
- ♦ Staining the wall face will blend the wall into the natural environment better.
- ♦ Less construction traffic to haul in material required.

Disadvantages

- ♦ The face of the wall is wire with a geotextile backing like dry stack walls.
- ♦ Are taller than concrete due to offsets for guardrail post support.
